1897-1964
THE JOURNAL OF INFECTIOUS DISEASES

The *Journal of Infectious Diseases* is devoted to the publication of original investigations dealing with the general phenomena, causation, and prevention of infectious diseases. It is the aim of the *Journal* to occupy a special field and to include only such contributions as bear with reasonable directness on the topics indicated in the title. The biology and chemistry of the various pathogenic organisms, the physiology and anatomy of the morbid processes they initiate, and the hygienic and sanitary problems to which they give rise are considered to be especially within the scope of this undertaking.

This *Journal* was established in connection with the John Rockefeller McCormick Memorial Institute for Infectious Diseases by the munificence of the late Mrs. Edith Rockefeller McCormick and the late Mr. Harold F. McCormick. Since 1941, it has been published in connection with the John Rockefeller McCormick Memorial Fund of the University of Chicago.

Submission of a manuscript to the *Journal* will be regarded as tacit declaration that the same material has not been accepted for publication elsewhere except as a preliminary report or as a privately printed dissertation.

Manuscripts are read by two or more members of the Editorial Board or other referees to determine their suitability for publication in the *Journal*. They are published bearing the date of receipt which, as far as possible, determines the order of publication.

The *Journal of Infectious Diseases* does not publish notes or preliminary communications.

INSTRUCTIONS TO AUTHORS

Careful inspection of recent numbers of the *Journal* will be of great help to the author in preparing his manuscript. Manuscripts should be sent by first class mail to the Editor, *Journal of Infectious Diseases*, 5724 South Ellis Avenue, Chicago, Illinois 60637, U. S. A.

Typing of manuscripts.—Manuscripts should be typed on 8½ × 11-inch paper with generous margins on all sides. All material, including tables and references, must be double spaced. All pages should be numbered. The original copy and the first carbon should be submitted, each with a complete set of illustrations.

Organization of papers.—Most manuscripts are divided into the following sections, appearing in this order: title page, introduction, methods, results, discussion, summary, references, tables, legends for figures.

Title page.—Each manuscript must have a title page containing the title, the name of the author, his affiliation, acknowledgments of assistance, advice and financial support, footnotes pertaining to the title or author, and a running head of not more than 40 letters and spaces.

References.—References are arranged in alphabetical order in double spaced copy at the end of the body of the paper. The journal abbreviations used are those given in the *Index Medicus*. Titles of original articles are not included. Both first and last page numbers are cited. Unpublished results and personal communications appear as parenthetical expressions in the body of the text and are not included in the list of references.
Examples of the most common forms of literature citations follow:

Maurer, P. H. 1956, J Immun 77: 105-110.

References are cited as: Smith and Jones (1954) reported... Their finding has now been confirmed (Johnson et al, 1960).

Tables.—Layout of tables should conform to Journal practice as illustrated by comparable tables in recent issues of the Journal. Tables are numbered in arabic in the order of reference in the text. Footnotes and accompanying explanatory material should be kept to a minimum. The same data may not be shown in both a table and a figure. All portions of every table must be double spaced. Vertical rules are not used.

Figures.—All illustrations are considered as figures: graphs, diagrams, artist's drawings, and photographs. They are given consecutive arabic numbers in order of appearance in the text. All figures larger than $8\frac{1}{2} \times 11$ inches should be photographed, printed on paper no larger than $8\frac{1}{2} \times 11$, and only the prints submitted. Each figure should be identified with the author's name and the figure number written outside the area of reproduction.

Line drawings should be prepared with black drawing ink and mechanical lettering guides. Do not use a typewriter. All lines, letters, numbers, and symbols must be clearly visible when reduced to the width of a Journal column ($2\frac{1}{2}$ inches).

Photographs for halftone cuts should be of the highest quality with respect to sharpness of detail and contrast. The magnification of photomicrographs and electron micrographs should be given in the figure legend and, wherever possible, a micron scale placed on the figure itself.

Each figure should have a brief explanatory legend. Legends are not placed on the figures themselves but are collected and typed all together in double spaced copy.

Footnotes.—Use footnotes sparingly in both text and tables. The symbols for footnotes, in order of use, are: *, †, ‡, §, ‖, ‡‡, **. Footnotes are typed double spaced in order of appearance at the bottom of the text page or table in which they occur.

Nomenclature.—Binomial Latin names of microorganisms, metazoan parasites, and metazoan hosts should agree with the appropriate International Rules of Nomenclature. Binomials are underlined once in typescript and appear in print in italics. Specific names are not used without the accompanying generic name. The generic name is written in full in the title and at first appearance in the text and in the summary. Elsewhere, the initial letter of the generic name may be used if no confusion results. When generic names are used in the vernacular, they are neither capitalized nor italicized.

The nomenclature of chemical compounds should agree with the indexes of Chemical Abstracts.

Numbers.—Numbers are indicated by arabic numerals except at the beginning of sentences. A cipher is placed to the left of each decimal point (0.205). All numbers should be rounded off to match the significance of the observation. Dilutions are shown as $1:2$, $1:4$, $1:8$, etc.

Latin derivatives.—Words and phrases
of Latin origin now in common English usage are not italicized: in vitro, in vivo, in utero, et al, i.e., e.g., etc.

**Abbreviations.**—The following common abbreviations are used without periods: centimeter — cm, degrees Centigrade — °C, gram — g, kilogram — kg, 50% lethal dose — LD₅₀, liter — L, microgram — μg, milligram — mg, microliter — μl, milliliter — ml, microcurie — μc, millicurie — mc, micron — μ, millimicron — μμ, molar — M, normal — N, optical density — OD, per cent — %, relative centrifugal force — rcf, revolutions per minute — rpm, standard deviation — SD, standard error — SE.

Abbreviations of chemical compounds of biological importance should generally follow those suggested by the *Journal of Biological Chemistry.*

The author should resist the temptation to introduce new abbreviations into the literature. Abbreviations for microorganisms, culture media, reagents, and laboratory methods should be used only when they are already well established in the literature or when the frequent use of a long and cumbersome term makes an abbreviation an aid to easy reading. Such abbreviations should be carefully defined on their first appearance in the text, redefined if used in the summary, and never used in the title. When abbreviations cannot be avoided, combinations of capital letters without spaces or periods are preferable.

**Proof.**—Galley proof is sent to the author as soon as his paper is set in type. Proof should be corrected with great care and returned at once to the Editorial Office. Delay in returning proof will delay publication. Excessive changes in galley proof will be charged to the author. The author does not receive page proof.

**Reprints.**—Reprints are furnished at reasonable cost. A reprint order form is sent with the galley proof and should be returned with the corrected proof. Since the type set for each number is destroyed immediately after printing, late reprint orders cannot be filled.

**Charges.**—Authors are charged one-third the cost of setting tables and one-half the cost of black and white illustrations. The entire cost of color reproduction is paid by the author.
